EDUCATION

B.S. (2025) Major: Computer Science; GPA: 2.839 – New Mexico State University, Las Cruces, NM

PROFESSIONAL EXPERIENCE

Sport League Scorekeeper (2015 - 2019)

Keeping track of the scores, clock, and statistics of basketball games. Practiced basic problem-solving skills when handling coaches. Practiced teamwork with referees.

Part-time Teller, White Sands Federal Credit Union (2023)

A small local credit union that remains active in the community with local and collegiate sports as well as community service during small local events. Interacted with members to complete transactions, including deposits, withdrawals, balancing, money orders, cashiers' checks, etc. Customer service skills, teamwork with other tellers, mathematical skills, experience learning new systems, money handling, problem solving.

Key Accomplishments:

- Met every milestone before expected date. Received exceptional work evaluation.
- No major balancing issues

TECHNOLOGY SKILLS & QUALIFICATIONS

Systems & Languages: JAVA, C++, C, Python, Windows, UNIX (Linux), Godot Game Engine, MySQL

Applications: PowerPoint, Excel, Microsoft Word

PROFESSIONAL AFFILIATIONS & COMMUNITY ACTIVITIES

- Volunteer Coach, Bantam Weight Sports Association
 - Volunteer Coach, Southwest Sports Association
-

Projects

- J Compiler
 - Created a compiler for a programming language named J created by Professor Jonathon Cook at NMSU and was a solo .
 - The compiler uses Yacc and Lex in C to compile J code into Risc-V assembly. This compiler handles user-built functions, basic functions such as a print method, if-then-else statements, argument passing, global and local variables, expressions, and handles while loops. J is a very keyword heavy language.
- In The Depths
 - "In The Depths" had a team of three developers and was developed using the Godot Game Engine and programming language.

- “In The Depths” is a single player game in which the player is inside a dungeon and is fighting creatures by clicking with the sole goal of getting stronger and defeating stronger enemies.
- ScheduleBuilderAI
 - “ScheduleBuilderAI” was a solo-project completed in python.
 - “ScheduleBuilderAI” takes an input file that is formatted in a very specific manner. Parses through this input to determine a workable schedule for the user. The input includes the names of each subject being scheduled, the start times of whatever they are being scheduled for, and the constraints that must be followed (I.e. Employee 1 can’t work at 9am, and Employee’s 3 and 4 can’t work at the same time)
- Card Game Challenger
 - “Card Game Challenger” had a team of 5 developers created using Java. The project was never completed but was in a working state.
 - “Card Game Challenger” is a single player game in a birds-eye view in which the user is in a small open world map with NPC’s spread out around the world for the user to talk to and initialize card games such as Poker, Blackjack, and High Card.
 - The open world movement, NPC’s code, and card games are all in the source code, though the card games are inaccessible. Launching the card games when talking to an NPC was the final unfinished task for the project.
- Untitled Game Launcher
 - The most recently started project currently in development still is a game launcher being developed in the QT C++ framework by 2 developers.
 - This launcher is meant to be an easy means of organizing and managing every game on the user’s system. Using APIs to connect to other launchers such as Steam to combine every game into a single library that works as a sort of tool bar on the side of the user’s screen.
