

User Study 2 Report

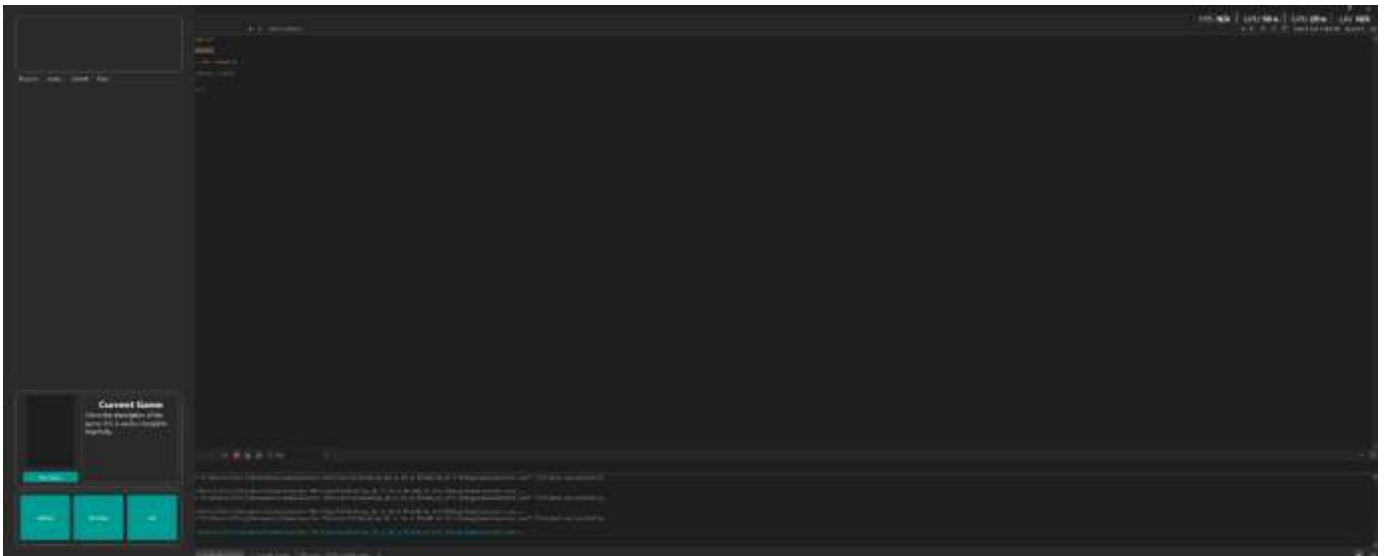

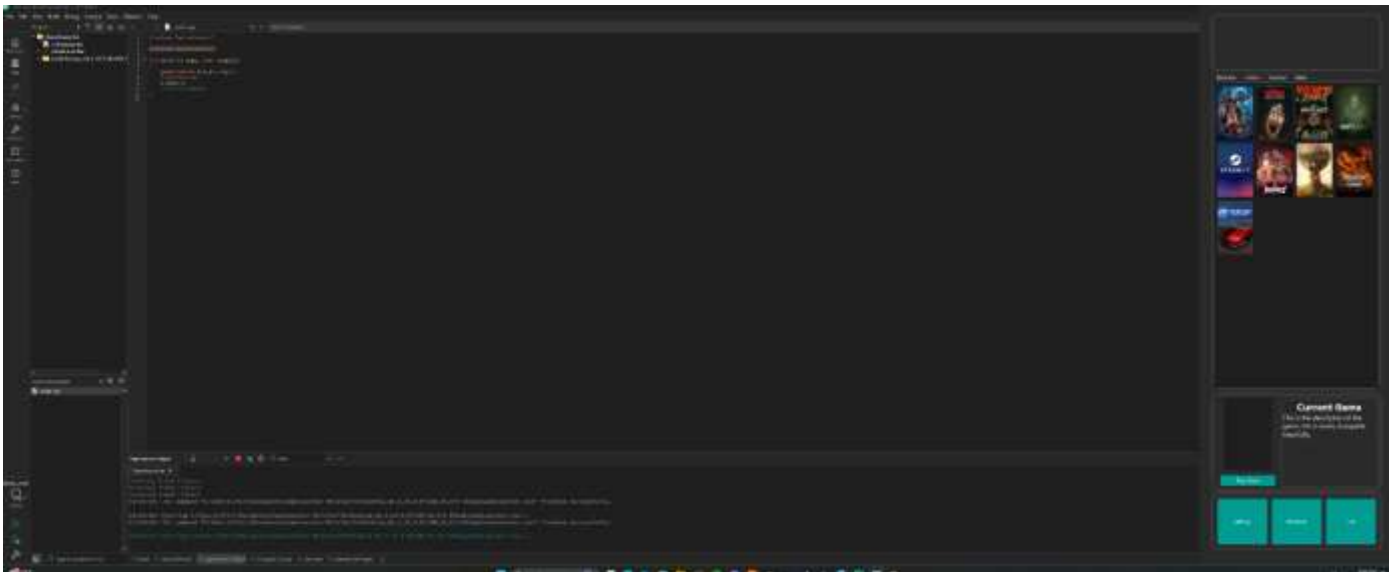

Tasks

The tasks we had the interviewees complete were quite simple. We wanted them to first test the always on top function. Then they tested the screen snapping and minimizing, then they launched a few different games. Then we just let them go through and test whatever.

Prototype

Full Screen:

Questions

The questions we asked for this second batch of the user study are:

- What portion of screen space would you prefer each individual portion to take up?
- What order do you think these sections should be in?
- What suggestions do you have for improving the prototype I've shown you?
- What sort of menus would you want in an application like this?

- Do you have any thoughts on the color scheme? If so, what are they?
- What are your thoughts on the width of the program?
- What do you like about each prototype version we've shown you?
- What do you dislike about this prototype?

Methods

When questioning someone, we first showed them the application and asked them the first two questions. We would then allow them to mess with it a little and show them the main features. we would follow that with asking the rest of the questions and rephrasing the questions if necessary (I.e. At the end of "What sort of menus would you want in an application like this?" we would add "Do you think the current menus are good or is there something missing and if so, what?").

Interesting Suggestions

The suggestions we find most interesting are That we need to replace all the buttons with icons, make the news sections smaller and game section larger, either buttons on top or allow order customization. One that was especially interesting is that we were suggested to make a color scheme icon that matches the user's window's color scheme. Making the top part news was almost unanimous. We were told that the white font on teal buttons wasn't great and it should be darker and larger font, resize based on monitor size. One gave the idea that there should be some form of indicator of what platform a game used, mainly focused on the emulation aspect. It was also suggested we add some sort of journaling feature that worked per game that was out of scope but a neat idea.

Chosen Design

The design we have chosen is that we think we will move the buttons on top and make them icons, we will move everything else down a spot. We can change the game-highlighting panel to use the platform indicator. Then, we can add news to a news screen and in the small frame. we will change the font on the buttons. If there is still time, then we will try to add the windows color palette sync and allow the user to change the widths of the program.
